

Ericsson AI Platform – RAG Demo Document

Overview

The Ericsson AI Platform provides services for deploying and operating artificial intelligence applications. The platform supports model serving, document processing, retrieval, and API-based access to language models.

Model Serving

Small language models can be served through an OpenAI-compatible API. The serving layer manages model inference and accepts chat completion requests.

Document Processing

Documents are processed by extracting text, cleaning the text, and dividing it into smaller chunks. The chunks can then be converted into vector embeddings for semantic search.

Retrieval-Augmented Generation

RAG combines document retrieval with language model generation. A user query is converted into an embedding and compared with stored document embeddings. The most relevant chunks are retrieved and provided to the language model as context.

Security

Incoming user prompts should be checked for personally identifiable information before they are forwarded to a language model. Detected PII can be replaced with anonymized placeholders.
